CHEM1112 - General Chemistry II

Credits:	5 (4/1/0)
Description:	Meets MnTC Goal Areas 2 and 3. This course is the second of a two-course series (CHEM1111 and CHEM1112) intended for science majors. Students will learn the general chemistry principles: intermolecular forces, properties of solids and liquids, solution chemistry, kinetics, chemical equilibrium, acid-base equilibrium, solubility equilibrium, thermodynamics, electrochemistry, nuclear chemistry, and possibly coordination chemistry and an introduction to environmental chemistry. The course includes a lab. Students completing the two-semester sequence will be competent in all the areas listed in General Chemistry I & II of the Minnesota State Chemistry Transfer Pathway.
Prerequisites:	• CHEM1111 • MATH1114
Corequisites:	
Pre/Corequisites [*] :	

Competencies:	 Identify the dominant intermolecular force of a molecular compound and make qualitative predictions concerning the physical properties of the condensed phases. Explore phase changes: Analyze the energetics of solution formation and several solution concentrations including percent, molarity, molality and mole fraction. Describe and perform mathematical calculations for solution colligative properties. Solve kinetic chemistry problems using experimental data and proposed reaction mechanisms. Apply integrated rate law and half-life equation. Use dynamic equilibrium principles and experimental data to solve equilibrium problems including equilibrium shifts using Le Chatelier's Principle. Analyze acids and bases using the Arrhenius, Brønsted-Lowry and Lewis definitions as well as acid and base dissociation constants. Calculate PH of acids, bases and buffer solutions, and construct acid/base titration curves 10. Calculate PH of acids, bases and buffer solutiong the common ion effect, pH and complex ion formation. Determine oxidation numbers and balance aqueous redox reactions in acidic and basic solutions. Calculate AH, AS and AG for phase transitions and the equilibrium constant. Acalculate AH, AS and AG for phase transitions and the micial reactions (including finding the temperature range [and the value of T⁴], over which a reaction is spontaneous) using appropriate standard values from thermodynamic quantities such as enthalpy, entropy and Gibbs energy, and the direction of change in natural processes. Predict, on the basis of qualitative reasoning, the sign of the ΔS for reactions and phase transitions. Relate thermodynamic data (ΔH, ΔS, and ΔG) to the value of the equilibrium constant for a reaction (neclers). Relate thermodynamic data (ΔH, ΔS, and ΔG) to the value of the equilibrium constant for a reaction (nad vic
MnTC goal areas:	2. Critical Thinking 3. Natural Sciences

**Can be taking as a Prerequisite or Corequisite.*
